Note: Within nine months from the publication of the mention of the grant of the European patent, any person may give notice to the European Patent Office of opposition to the European patent granted. Notice of opposition shall be filed in a written reasoned statement. It shall not be deemed to have been filed until the opposition fee has been paid. (Art. 99(1) European Patent Convention).

Description**TECHNICAL FIELD**

5 The subject invention relates to anionic polymerization resulting in diene polymer and copolymer elastomers. More particularly, the present invention relates to polymerization employing a lithio amine initiator, an organic alkali metal compound and a chelating reagent. The resulting polymers are chain-end modified and contain a high amount of styrene.

BACKGROUND ART

10 When conducting polymerizations on a commercial basis, it is important to utilize process conditions and components which will allow the molecular weight of the end products to be narrowly and reproducibly defined. The characteristics of a given polymer and its usefulness, are dependent, among other things, upon its molecular weight. Hence, it is desirable to be able to predict with some certainty the molecular weight of the end product of the polymerization. When the molecular weight is not narrowly definable, or is not reproducible on a systematic basis, the process is not commercially viable.

In the art, it is desirable to produce elastomeric compounds exhibiting reduced hysteresis characteristics. Such elastomers, when compounded to form articles such as tires, power belts and the like, will show an increase in rebound, a decrease in rolling resistance and will have less heat build-up when mechanical stresses are applied.

20 A major source of hysteretic power loss has been established to be due to the section of the polymer chain from the last cross link of the vulcanizate to an end of the polymer chain. This free end cannot be involved in an efficient elastically recoverable process, and as a result, any energy transmitted to this section of the cured sample is lost as heat. It is known in the art that this type of mechanism can be reduced by preparing higher molecular weight polymers which will have fewer end groups. However, this procedure is not useful because processability of the rubber with compounding ingredients and during shaping operations decreases rapidly with increasing molecular weight.

25 It is difficult to obtain consistent properties, such as a reduction in hysteresis properties, if the polymer cannot be controllably reproduced in a narrow molecular weight range distribution. See, for example, U.S. Pat. No. 4,935,471, in which some polymers are prepared with a heterogeneous mixture of certain secondary amines, including lithium pyrrolidide. Polymers made in this manner have widely variable molecular weights, broad polydispersities, their functional terminations tend to reproduce erratically, giving rise to poorly reproducible hysteresis reduction results.

30 It is known in the art to employ a lithium amide with an alkali metal compound, such as, for example, as discussed in Japanese Pat. No. 7,965,788. That patent does not disclose the use of a chelating agent as in the present invention. Polymerization to form certain rubber compounds such as styrene/butadiene rubber (SBR) with higher styrene content by using only a lithium amide initiator and alkali metal compound randomizers in acyclic alkanes, causes the formation of a heterogeneous polymer cement, which is comprised of a mixture of widely different styrene content molecules. This makes it difficult to achieve the desired molecular weight and to difficult to control styrene sequence distribution. The presence of such cements often interferes with desirable rubber properties in the polymer.

35 Furthermore, a major drawback with many of these known initiators, is that they are not soluble in hydrocarbon solvents such as hexane or cyclohexane. Polar solvents have heretofore been employed including the polar organic ethers such as dimethyl or diethyl ether, tetrahydrofuran, tetramethylethylenediamine, or diethylene glycol methyl ether (diglyme).

40 The invention also provides for the incorporation of a functionality from the initiator to be incorporated into the polymer chain, such that two or more of the ends of the resulting polymer chains are modified. Hysteresis characteristics of the resulting products are effectively reduced, and other physical characteristics are improved. The invention provides for efficient, controllable and reproducible polymerizations, with the preparation of well defined end-products of a relatively narrow molecular weight distribution range. Furthermore, there is provided a means of controlling the sequence distribution of vinyl aromatic monomers, such as styrene, along a polymer backbone, to improve the hysteresis properties, tear strength and wear resistance of the resulting products.

DISCLOSURE OF THE INVENTION

45 It is therefore, an object of the present invention to provide a hydrocarbon soluble anionic polymerization initiator.

50 It is an object of one embodiment of the present invention to provide a randomized, high styrene, styrene/butadiene rubber, which includes polymer chains wherein both ends of the chains are modified.

It is a further object of the present invention to provide a method of preparing such an anionic polymerization initiator.

It is still a further object of the invention to provide an initiator which will reproducibly produce a polymer within a narrow, predictable molecular weight range.

It is another object of the present invention to provide elastomers formed with such a polymerization initiator.

It is also an object of certain embodiments of the present invention to provide diene polymers and copolymers having improved, that is, reduced hysteresis characteristics.

It is a further object of the present invention to provide vulcanizable elastomeric compounds.

Still another object of the present invention is to provide an improved tire formed from an elastomer as above.

An additional object of the invention is to provide randomized, high styrene, styrene/butadiene rubber.

These and other objects together with the advantages thereof over the existing art, which shall become apparent from the specification which follows, are accomplished by the invention as hereinafter described and claimed.

In general, the present invention provides a hydrocarbon soluble, anionic polymerization initiator comprising a mixture of (i) a lithio amine having the general formula $(A)Li(SOL)_y$, where y is 0 or from 0.5 to 3; SOL is a solubilizing component selected from the group consisting of hydrocarbons, ethers, amines or mixtures thereof; and, A is selected from the group consisting of alkyl, dialkyl, cycloalkyl or dicycloalkyl amine radicals having the general formula

and cyclic amines having the general formula

Each R_1 is independently selected from the group consisting of alkyls, cycloalkyls and aralkyls having from 1 to 12 carbon atoms

and R_2 is selected from the group consisting of a divalent alkylene, oxy- or amino-alkylene group having from 3 to 12 methylene groups. The mixture also comprises (ii) an organic alkali metal compound; and, (iii) a chelating reagent.

There is also provided a method of preparing an anionic polymerization initiator comprising the step of forming a reaction product by reacting an organolithium compound with a functionalizing agent; the functionalizing agent being selected from the group consisting of alkyl, dialkyl, cycloalkyl or dicycloalkyl amine radicals having the general formula

and cyclic amines having the general formula

Each R_1 is independently selected from the group consisting of alkyls, cycloalkyls and aralkyls having from 1 to 12 carbon atoms, and R_2 is selected from the group consisting of a divalent alkylene, oxy- or amino-alkylene group having from 3 to 12 methylene groups. The method also includes mixing the reaction product with an organic alkali metal compound; and a chelating reagent. The organolithium compound has the general formula RLi where R is selected from the group consisting of alkyls, cycloalkyls, alkenyls, aryls and aralkyls having from 1 to 20 carbon atoms

and short chain length low molecular weight polymers from diolefin and vinyl aryl monomers having up to 25 units.

A process for preparing an elastomeric compound having reduced hysteresis properties, is also within the scope of the present invention, and comprises the steps of forming a solution of one or more anionically polymerizable monomers in a hydrocarbon solvent; and polymerizing the monomer with a mixture of a lithio amine and an organic alkali metal compound to form a polymer; wherein the lithio amine having the general formula

where y is 0 or from 0.5 to 3; SOL is a solubilizing component selected from the group consisting of hydrocarbons, ethers, amines or mixtures thereof; and, A is selected from the group consisting of alkyl, dialkyl, cycloalkyl or dicycloalkyl amine radicals having the general formula

and cyclic amines having the general formula

Each R_1 is independently selected from the group consisting of alkyls, cycloalkyls and aralkyls having from 1 to 12 carbon atoms, and R_2 is selected from the group consisting of a divalent alkylene, oxy- or amino-alkylene group having from 3 to 12 methylene groups.

A polymer according to the invention is prepared by forming a solution of one or more anionically polymerizable monomers in a hydrocarbon solvent; and, polymerizing the monomer with a mixture of a lithio amine and an organic alkali metal compound to form the polymer. The lithio amine has the general formula

where y is 0 or from 0.5 to 3; SOL is a solubilizing component selected from the group consisting of hydrocarbons, ethers, amines or mixtures thereof; and, A is selected from the group consisting of alkyl, dialkyl, cycloalkyl or dicycloalkyl amine radicals having the general formula

and cyclic amines having the general formula

where each R_1 is independently selected from the group consisting of and alkyls, cycloalkyls and aralkyls having from 1 to 12 carbon atoms, and R_2 is selected from the group consisting of a divalent alkylene, oxy- or amino-alkylene group having from 3 to 12 methylene groups.

5 PREFERRED EMBODIMENTS FOR CARRYING OUT THE INVENTION

As will become apparent from the description which follows, the present invention provides novel polymerization initiators which are soluble in hydrocarbon solvents, such as preferably, cycloalkanes such as cyclohexane, cycloheptane, derivatives thereof and the like, and mixtures of these with alkanes such as hexane, pentane, heptane, octane, their alkylated derivatives, and the like. By soluble, it is understood to mean a solubility of up to a one molar concentration at room temperature. It has also been discovered herein that certain rubber compositions, vulcanizable elastomeric compositions and articles thereof based upon polymers formed using such initiators, exhibit useful properties, such as for example, reproducible relatively narrow molecular weight ranges. Furthermore, the polymers according to the invention also contain a functionality from the initiator, which functionality is useful for example, in desirably reducing hysteresis characteristics. Further still, it has been found that products according to the present invention, when mixed with carbon black, also exhibit improved physical properties, such as high tensile and tear strength and wear resistance properties.

The invention is particularly suited, although it is not necessarily limited to, the production of reduced hysteresis, chain-end modified, high styrene styrene/butadiene rubber (SBR). When compounded with other ingredients as will be addressed hereinbelow, the resulting elastomer product possesses increased rebound, decreased rolling resistance and/or less heat buildup. Such elastomer products can be used to form improved, energy-efficient tires, power belts and mechanical goods.

The present invention employs a mixture of an amine initiator, an alkaline metal organic randomizer and optionally, a chelating reagent. This mixture is then used as an initiator to cause an ensuing polymerization, as will also be more fully described hereinbelow. Because of the presence of the alkaline metal organic randomizer and optionally, the chelating reagent, the resulting elastomers and other products according to the invention, exhibit not only reduced hysteresis characteristics, but also improved tensile, tear and wear strengths.

A preferred soluble initiator according to the present invention, is one where no solubilizing component is present in the lithio amine compound (that is, the subscript y is zero in the formula hereinbelow). Another preferred initiator according to the invention, is one where SOL is present and the initiator is the reaction product of an amine, an organo lithium and a solubilizing component, SOL. The organo lithium and the amine may be reacted in the presence of the solubilizing component or agent, or they may be reacted first and the reaction product thereof subsequently reacted with the solubilizing component. A preferred initiator is therefore, a solubilized lithio amine having the general formula

where y is from 0 to 3. When SOL is not present, $y = 0$, and when SOL is present it is preferred that $y = 0.5$ to 3. The parentheses of this general formula indicate that the formula may include $A-Li-SOL_y$; SOL_y-A-Li ; or, $A-SOL_y-Li$.

(SOL) is a solubilizing component and may be a hydrocarbon, ether, amine or a mixture thereof. It has been discovered that by the presence of the (SOL) component, the initiator is soluble in hydrocarbon solvents according to the above definition.

According to a preferred embodiment A is perhydroazepine, y is 2 and SOL is selected from the group consisting of tetrahydrofuran and tetramethylethylenediamine.

Exemplary (SOL) groups include dienylyl or vinyl aromatic polymers or copolymers having a degree of polymerization of from 3 to 300 polymerization units. Such polymers include polybutadiene, polystyrene, polyisoprene and copolymers thereof. Other examples of (SOL) include polar ligands, such as tetrahydrofuran (THF) and tetramethylethylenediamine (TMEDA).

The (A) component represents the amine functionality, at least one of which is carried by the resulting polymer, such as by being incorporated at the initiation site or head thereof. For example, (A) may be an alkyl, dialkyl, cycloalkyl or a dicycloalkyl amine radical having the general formula

and cyclic amines having the general formula

In these formulas, each R_1 is an alkyl, cycloalkyl or aralkyl having from 1 to 20 carbon atoms, where both R_1 groups may be the same or different (that is, they are independently selected from that group), and R_2 is a divalent alkylene, bicycloalkane, oxy- or amino-alkylene group having from 3 to 12 methylene groups.

Exemplary R_1 groups include methyl, ethyl, butyl, octyl, cyclohexyl, 3-phenyl-1-propyl, isobutyl and the like. Exemplary R_2 groups include trimethylene, tetramethylene, hexamethylene, oxydiethylene, N-alkylazadiethylene and the like.

For example, (A) may be a derivative of pyrrolidine, that is, C_4H_8NH ; piperidine such as for example, piperidine and 3-methylpiperidine; 4-alkylpiperazine such as for example, 4-propylpiperazine; perhydroazepine, also known as hexamethyleneimine; or 1-azacyclooctane; including bicyclics such as perhydroisoquinoline, perhydroindole, and the like. Pyrrolidine (resulting in for example, N-Li-pyrrolidide or "NLiP"), perhydroazepine and 1-azacyclooctane are preferred. A preferred pyrrolidine derivative is perhydroindole and a preferred piperidine derivative is perhydroisoquinoline. (A) may also be 1,3,3-trimethyl-6-azabicyclo [3.2.1] octane, diisobutyl amide, or the like.

It has been found that when one or both R_1 and R_2 are both t-butyl groups, both isopropyl groups or the like, the resulting polymerizations are slow, presumably due to hindrance around the nitrogen at the initiation site. Hence, in a preferred embodiment of the invention, the carbon atoms in R_1 and R_2 which are bonded to the nitrogen in the amine, are also bonded to at total of at least three hydrogen atoms.

The initiator according to the present invention can be formed by preparing a solution of the amine component (A), in an anhydrous, aprotic solvent, such as cyclohexane, preferably in the presence of (SOL), if (SOL) is to be employed and if it is an ether or an amino compound. To this solution is then added an organolithium catalyst in the same or a similar solvent. The organolithium compound has the general formula RLi where R is selected from the group consisting of alkyls, cycloalkyls, alkenyls, aryls and aralkyls having from 1 to 20 carbon atoms and short chain length low molecular weight polymers from diolefin and vinyl aryl monomers having up to 25 units. Typical alkyls include n-butyl, s-butyl, methyl, ethyl, isopropyl and the like. The cycloalkyls include cyclohexyl, menthyl and the like. The alkenyls include allyl, vinyl and the like. The aryl and aralkyl groups include phenyl, benzyl, oligo(styryl) and the like. Exemplary short chain length polymers include the oligo(butadienyls), oligo(isoprenyls), oligo(styryls) and the like.

If (SOL) is a short chain length polymer, that is, an oligomer, the monomers to used to form (SOL) are added after the amine and the organolithium are mixed, as will be described hereinbelow.

To the solution of the amine and the organolithium, is then added a solution of the monomers of the solubilizing component (SOL) in the same or similar solvent, if (SOL) is employed and if it is an oligomer. The monomers may be selected from the group consisting of styrene and butadiene, and mixtures thereof. The three components are allowed to react for up to about one hour at ambient temperature (15° to 30° C), or elevated temperatures up to about 100° C preferably at less than 50° C, and more preferably at less than 38° C, following which the catalyst is ready for use. The initiators according to the present invention are considered to be soluble if they remain in solution within an excess of a hydrocarbon solvent for about three (3) days, at a concentration of up to about one molar.

The organic alkali metal compound is preferably selected from the group consisting of compounds having the general formula R_3M , R_4OM , $R_5C(O)OM$, R_6R_7NM , and R_8SO_3M , where R_3 , R_4 , R_5 , R_6 , R_7 , and R_8 are each selected from the group consisting of alkyls, cycloalkyls, alkenyls, aryls, or phenyls, having from about 1 to about 12 carbon atoms. The component M is selected from the group consisting of Na, K, Rb or Cs. Preferably, M is Na or K.

For example, R_3M may include methyl sodium, ethyl potassium, n-propyl rubidium, ethylcesium, t-butyl sodium, t-amylpotassium, n-hexylrubidium, phenyl potassium, benzyl sodium, and the like.

The compound R_4OM , may include for example, alkali metal salts of monovalent and polyvalent alcohols, and monovalent and polyvalent phenols, such as sodium (Na), potassium (K), rubidium (Rb) or cesium (Cs) salts of methyl

alcohol, ethyl alcohol, n-propyl alcohol, isopropyl alcohol, t-butyl alcohol, t-amyl alcohol, n-hexyl alcohol, cyclohexyl alcohol, t-butenyl alcohol, 4-methylcyclohexyl alcohol, phenol, benzyl alcohol, catechol, resorcinol, 1-naphthol, 2,6-di-t-butyl-methylphenol, n-nonylphenol, and the like.

The R_5COOM may include for example, alkali metal salts of mono- and poly-carboxylic acids such as Na, K, Rb and Cs salts of lauric acid, myristic acid, palmitic acid, stearic acid, arachic acid, linoleic acid, phenylacetic acid, benzoic acid, sebacic acid, phthalic acid, and the like.

The compound R_6R_7NM may include for example, alkali metal salts of secondary amine such as Na, K, Rb and Cs salts of dimethylamine, di-n-butylamine, methyl-n-hexylamine, diphenylamine, dibenzylamine, and the like.

The compound R_8SO_3M may include for example, alkali metal salts of sulfonic acids, such as Na, K, Rb and Cs salts of dodecylbenzenesulfonic acid, tetradecylbenzenesulfonic acid, hexadecylbenzenesulfonic acid, octadecylbenzenesulfonic acid, and the like.

Suitable polymerization modifiers such as ethers or amines may also be used by combining with alkali metal compounds, to provide the desired microstructure and randomization of the comonomer units.

The mixture according to the invention preferably includes a mixture ratio of the organic alkali metal compound of from 0.5 to 0.02 equivalents thereof per equivalent of lithium in the lithio amine initiator.

The chelating reagent can be employed to help prevent heterogeneous polymerization. Useful such reagents include for example, tetramethylethylenediamine (TMEDA), oxolanyl cyclic acetals and cyclic oligomeric oxolanyl alkanes and the like. The oligomeric oxolanyl alkanes may be represented by the structural formula

and,

wherein R_9 and R_{10} independently are hydrogen or an alkyl group and the total number of carbon atoms in $-CR_9R_{10}-$ ranges between one and nine inclusive; y is an integer of 1 to 5 inclusive; y' is an integer of 3 to 5 inclusive; and R_{11} , R_{12} , R_{13} , and R_{14} independently are $-H$ or $-C_nH_{2n+1}$ wherein $n = 1$ to 6.

The compounds of the first formula are linear oligomers and the modifiers represented by the second structural formula are cyclic oligomers and further details thereof can be found in U.S. Pat. No. 4,429,091,

Furthermore, details regarding the oxolanyl cyclic acetals can be found in U.S. Pat. No. 5,112,929.

The mixture according to the invention preferably includes a mixture ratio of the chelating reagent of from 2 to 0.01 equivalents thereof per equivalent of lithium in the lithio amine initiator. A ratio in the range of 0.02 to 0.1 is preferred.

As stated above, the initiator mixture thus formed may be employed as an initiator to prepare any anionically-polymerized elastomer, e.g., polybutadiene, polyisoprene and the like, and copolymers thereof with monovinyl aromatics such as styrene, alpha methyl styrene and the like, or trienes such as myrcene. Thus, the elastomers include diene homopolymers and copolymers thereof with monovinyl aromatic polymers. Suitable monomers include conjugated dienes having from about 4 to about 12 carbon atoms and monovinyl aromatic monomers having 8 to 18 carbon atoms

and trienes, and mixtures thereof. Examples of conjugated diene monomers and the like useful in the present invention include 1,3-butadiene, isoprene, 1,3-pentadiene, 2,3-dimethyl-1,3-butadiene and 1,3-hexadiene, and aromatic vinyl monomers include styrene, *a*-methylstyrene, *p*-methylstyrene, vinyltoluene and vinylnaphtalene. The conjugated diene monomer and aromatic vinyl monomer are normally used at the weight ratios of 95-50:5-50, preferably 85-55:15-45. It is most preferred that the polymer have a high styrene content, that is, a styrene content of about 20 percent by weight or more.

Polymerization is conducted in a hydrocarbon solvent as indicated hereinabove, such as the various hexanes, heptanes, octanes, mixtures thereof, and the like. In order to promote randomization in copolymerization and to control vinyl content, a polar coordinator or other chelating reagents may be added to the polymerization ingredients. Amounts range between 0 and 90 or more equivalents per equivalent of lithium. The amount depends on the amount of vinyl desired, the level of styrene employed and the temperature of the polymerization, as well as the nature of the specific polar coordinator (modifier) employed.

Compounds useful as polar coordinators and other chelating reagents are organic, and include, for example, tetrahydrofuran, linear and cyclic oligomeric oxolanyl alkanes such as 2-2'-di(tetrahydrofuryl) propane, di-piperidyl ethane, hexamethylphosphoramide, *N,N'*-dimethylpiperazine, diazabicyclooctane, dimethyl ether, diethyl ether, tributylamine and the like. The linear and cyclic oligomeric oxolanyl alkane modifiers are described in U.S. Pat. No. 4,429,091.

Other compounds useful as polar coordinators include those having an oxygen or nitrogen hetero-atom and a non-bonded pair of electrons. Examples include dialkyl ethers of mono and oligo alkylene glycols; "crown" ethers; tertiary amines such as tetramethylethylenediamine (TMEDA); tetrahydrofuran (THF), linear THF oligomers and the like.

A batch polymerization is begun by charging a blend of monomer(s) and hydrocarbon solvent to a suitable reaction vessel, followed by the addition of the polar coordinator (if employed) and the initiator compound previously described. The reactants are heated to a temperature of from 20 to 200°C, and the polymerization is allowed to proceed for from 0.1 to 24 hours. A functional amine group is derived from the initiator compound and bonds at the initiation site. Thus, substantially every resulting polymer chain has the following general formula

AYLi

where A is as described above, and Y is a divalent polymer radical which is derived from any or all of the foregoing diene homopolymers, monovinyl aromatic polymers, diene/monovinyl aromatic random copolymers and block copolymers. The monomer addition at the lithium end causes the molecular weight of the polymer to increase as the polymerization continues.

To terminate the polymerization, and thus further control polymer molecular weight and polymer properties, a modifying agent such as a terminating agent, coupling agent or linking agent may be employed, all of these agents being collectively referred to herein as "modifying agents". Certain of these agents may provide the resulting polymer with a multifunctionality. That is, the polymers initiated according to the present invention may carry at least one amine functional group A as discussed hereinabove, and may also carry a second functional group selected and derived from the group consisting of modifying agents.

Useful modifying agents include the following or mixtures thereof: active hydrogen compounds such as water or alcohol; carbon dioxide; *N,N,N',N'*-tetradialkyldiamino-benzophenone (such as tetramethyldiaminobenzophenone or the like); *N,N*-dialkylamino-benzaldehyde (such as dimethylaminobenzaldehyde or the like); 1,3-dialkyl-2-imidazolidinones (such as 1,3-dimethyl-2-imidazolidinone or the like); 1-alkyl substituted pyrrolidinones; 1-aryl substituted pyrrolidinones; dialkyl- and dicycloalkyl-carbodiimides having from 5 to 20 carbon atoms; $(R_{15})_aZX_b$;

and,

where Z is tin or silicon. It is preferred that Z is tin.

R_{15} is an alkyl having from 1 to 20 carbon atoms; a cycloalkyl having from 3 to 20 carbon atoms; an aryl having from 6 to 20 carbon atoms; or, an aralkyl having from 7 to 20 carbon atoms. For example, R_{15} may include methyl, ethyl, n-butyl, neophyl, phenyl, cyclohexyl or the like.

X is chlorine, bromine or iodine, "a" is from 0 to 3, and "b" is from 1 to 4; where $a + b = 4$.

Each R_{16} is the same or different and is an alkyl, cycloalkyl or aryl, having from 1 to 12 carbon atoms. For example, R_{16} may include methyl, ethyl, nonyl, t-butyl, phenyl or the like.

R_{17} is an alkyl, phenyl, alkylphenyl or dialkylaminophenyl, having from 1 to 20 carbon atoms. For example, R_{17} may include t-butyl, 2-methyl-4-pentene-2-yl, phenyl, p-tolyl, p-butylphenyl, p-dodecylphenyl, p-diethyl-aminophenyl, p-(pyrrolidino)phenyl, and the like.

Each R_{18} is the same or different, and is an alkyl or cycloalkyl having from 1 to 12 carbon atoms. Two of the R_{18} groups may together form a cyclic group. For example, R_{18} may include methyl, ethyl, octyl, tetramethylene, pentamethylene, cyclohexyl or the like.

R_{19} may include alkyl, phenyl, alkylphenyl or dialkylaminophenyl, having from 1 to 20 carbon atoms. For example, R_{19} may include methyl, butyl, phenyl, p-butylphenyl, p-nonylphenyl, p-dimethylaminophenyl, p-diethylaminophenyl, p-(piperidino)phenyl, or the like.

Other examples of useful terminating agents include tin tetrachloride, $(R_1)_3\text{SnCl}$, $(R_1)_2\text{SnCl}_2$, $R_1\text{SnCl}_3$, carbodiimides, N-methylpyrrolidine, cyclic amides, cyclic ureas, isocyanates, Schiff bases, 4,4'-bis(diethylamino) benzophenone, and the like, where R_1 is as described hereinabove.

One preferred polymer according to the present invention, is a polymer which includes at least one functional group A as discussed hereinabove, wherein A is derived from the reaction product of an amine and an organolithium compound as also discussed hereinabove. Furthermore, a preferred polymer is multifunctional wherein the polymer also carries a tin-carbon bond, such as may be derived from the terminating, coupling or linking agent. A rubber composition or a vulcanizable rubber composition according to the present invention, may include such a polymer.

The modifying agent is added to the reaction vessel, and the vessel is agitated for about 1 to about 1000 minutes. As a result, an elastomer is produced having an even greater affinity for compounding materials such as carbon black, and hence, even further reduced hysteresis. Additional examples of terminating agents include those found in U.S. Patent No. 4,616,069.

The polymer may be recovered from the solvent by conventional techniques. These include steam or alcohol coagulation, thermal desolventization, or any other suitable method. Additionally, solvent may be removed from the resulting polymer by drum drying, extruder drying, vacuum drying or the like.

The elastomers of the present invention comprise a plurality of polymers, having a functional group at two or more

ends of the resulting polymer. Compounds of such polymers may result in products exhibiting reduced hysteresis, which means a product having increased rebound, decreased rolling resistance and has less heat build-up when subjected to mechanical stress.

It has also been found, as will be exemplified hereinbelow, that polymers formed using the initiators of the invention, are reproducibly polymerizable in a relatively narrow range of molecular weights, such as that substantially consistently reproducible polymers are possible with a molecular weight range of 20,000 to 250,000.

The polymers of the present invention can be used alone or in combination with other elastomers to prepare an elastomer product such as a tire treadstock, sidewall stock or other tire component stock compound. In a tire of the invention, at least one such component is produced from a vulcanizable elastomeric or rubber composition. For example, the polymers according to the invention can be blended with any conventionally employed treadstock rubber which includes natural rubber, synthetic rubber and blends thereof. Such rubbers are well known to those skilled in the art and include synthetic polyisoprene rubber, styrene/butadiene rubber (SBR), polybutadiene, butyl rubber, Neoprene, ethylene/propylene rubber, ethylene/propylene/diene rubber (EPDM), acrylonitrile/butadiene rubber (NBR), silicone rubber, the fluoroelastomers, ethylene acrylic rubber, ethylene vinyl acetate copolymer (EVA), epichlorohydrin rubbers, chlorinated polyethylene rubbers, chlorosulfonated polyethylene rubbers, hydrogenated nitrile rubber, tetrafluoroethylene/propylene rubber and the like. When the polymers of the present invention are blended with conventional rubbers, the amounts can vary widely such as between 10 and 99 percent by weight.

The polymers can be compounded with carbon black in amounts ranging from 5 to 100 parts by weight, per 100 parts of rubber (phr), with 5 to 80 parts being preferred and from 40 to 70 phr being more preferred. The carbon blacks may include any of the commonly available, commercially-produced carbon blacks but those having a surface area (EMSA) of at least 20 m²/g and more preferably at least 35 m²/g up to 200 m²/g or higher are preferred. Surface area values used in this application are those determined by ASTM test D-1765 using the cetyltrimethyl-ammonium bromide (CTAB) technique. Among the useful carbon blacks are furnace black, channel blacks and lamp blacks. More specifically, examples of the carbon blacks include super abrasion furnace (SAF) blacks, high abrasion furnace (HAF) blacks, fast extrusion furnace (FEF) blacks, fine furnace (FF) blacks, intermediate super abrasion furnace (ISAF) blacks, semi-reinforcing furnace (SRF) blacks, medium processing channel blacks, hard processing channel blacks and conducting channel blacks. Other carbon blacks which may be utilized include acetylene blacks. Mixtures of two or more of the above blacks can be used in preparing the carbon black products of the invention. Typical values for surface areas of usable carbon blacks are summarized in the following TABLE I.

TABLE I

CARBON BLACKS	
ASTM Designation (D-1765-82a)	Surface Area (m ² /g) (D-3765)
N-110	126
N-220	111
N-339	95
N-330	83
N-550	42
N-660	35

The carbon blacks utilized in the preparation of the rubber compounds of the invention may be in pelletized form or an unpelletized flocculent mass. Preferably, for more uniform mixing, unpelletized carbon black is preferred. The reinforced rubber compounds can be cured in a conventional manner with known vulcanizing agents at 0.5 to 4 phr. For example, sulfur or peroxide-based curing systems may be employed. For a general disclosure of suitable vulcanizing agents one can refer to Kirk-Othmer, Encyclopedia of Chemical Technology, 3rd ed., Wiley Interscience, N.Y. 1982, Vol. 20, pp. 365-468, particularly "Vulcanization Agents and Auxiliary Materials" pp. 390-402. Vulcanizing agents may be used alone or in combination.

Vulcanizable elastomeric or rubber compositions of the invention can be prepared by compounding or mixing the polymers thereof with carbon black and other conventional rubber additives such as fillers, plasticizers, antioxidants, curing agents and the like, using standard rubber mixing equipment and procedures and conventional amounts of such additives.

General Experimental

In order to demonstrate the preparation and properties of the initiator mixtures and elastomers according to the present invention, a number of such initiator mixtures and elastomers were prepared. A number of solutions of styrene

and butadiene monomers in hexane were prepared and were polymerized with the above described initiator mixtures. As noted above, various techniques known in the art for carrying out polymerizations may be employed without departing from the scope of the present invention.

In the following examples, parts and percents are by weight unless otherwise specified. Polymer structure was determined by gel permeation chromatography (GPC) for molecular weight and infrared spectroscopy (IR) for micro-structure of diene portion and nuclear magnetic resonance spectrum (NMR) for styrene content.

For evaluation of compounded properties, the strength at breakage was evaluated by using micro-dumbbell specimens. To evaluate hysteresis loss properties, the dynamic loss factor at 50°C (tan δ) was measured by means of a Dynastat viscoelastomer at 1 Hz. In general, the smaller the tan δ value, the lower the hysteresis loss.

Wear resistance was measured by means of a Lambourn abrasion tester and represented by an index based on the comparative example, as will be discussed hereinbelow. In general, the higher the index number, the better the wear resistance.

Example 1

Five pounds of styrene and butadiene blend (T.S.=19%), which had 38% styrene for total monomer, was charged in 3.8 l (1 gallon) reactor. To the reactor was then added 0.185 mmol of TMEDA, 0.247 mmol of t-AmyLOK and 3.3 mmol of the N-lithio salt of hexamethyleneimine, or "LHMI". The LHMI was prepared by treating 3.3 mmole of hexamethyleneimine with 3.7 mmole of n-butyllithium in hexanes, immediately prior to charging to the reactor for polymerization. Reaction temperature was set to 150°F (65°C). After 80 minutes, a small amount of polymer cement was taken and terminated by i-PrOH. To the rest of the cement was then added 1.8 mmol of Bu₂SnCl₂ with agitation for 30 minutes. The polymer cement was coagulated by i-PrOH and dried by drum dryer to obtain an SBR, reported hereinbelow as Polymer A. A comparative example polymer was made without TMEDA by using the same method described above. This comparative polymer is reported hereinbelow as Polymer B. Molecular weight information for Polymers A and B are reported in TABLE II hereinbelow.

TABLE II

ANALYSIS OF POLYMERS A AND B							
	Base Polymer			Coupled Polymer			
	ML ₄	Mn	Mw/Mn	ML ₄	Mn	Mw/Mn%	couple
Polymer A	35.0	1.17 x 10 ⁵	1.19	79.8	1.55 x 10 ⁵	1.67	40%
Polymer B	30.0	1.04 x 10 ⁵	1.25	75.5	1.55 x 10 ⁵	1.60	41%

This data shows that the use of TMEDA makes Mw/Mn narrower.

Example 2. NLIP Initiator and NaOR System

a) Bottle polymerization of NLIP · C₉H₁₉- ϕ -ONa System

NLIP2THF was prepared as follows. A mixture of 25.1 meq of pyrrolidine and 25.1 meq of n-butyllithium in hexane was stirred under nitrogen over a weekend at room temperature. This was treated with 50.2 meq of THF in hexane, and the resulting mixture was used to initiate the following polymerization.

A bottle polymerization was carried out using a 35 percent styrene/65 percent butadiene (wt/wt) blend in hexane (18% total solid). Five bottles were used at different conditions as follows:

	NLIP2THF/100g monomer	Na/Li	CA/Li
Bottle C	1.2 mmol	1/5	--
Bottle D	1.2	1/10	--
Bottle E	1.2	1/20	--
Bottle F	1.2	1/10	CA = 1/20
Bottle G	1.2	1/20	CA = 1/20

In this table, "CA" refers to the chelating reagent, and was a linear oligomeric oxolanyl propane. Sodium nonylphenoxide was used. Polymerization reaction was carried out at 50°C for 4 hours and terminated by addition of isopropyl alcohol ("i-PrOH"). The polymer cement of each bottle C-G, corresponding to Polymers C-G respectively, was a clear yellow

solution. The polymers were isolated by coagulation in i-PrOH, treated with an antioxidant (butylated hydroxy toluene) and drum dried. Analysis data for Polymers C-G are listed in TABLE III.

TABLE III

ANALYSIS OF POLYMERS C-G					
Polymer	Conversion	Mn	Mw/Mn	Vinyl ^a	Styrene
C	83.1%	1.2E5	1.64	37.0%	34.5%
D	83.0%	1.1E5	1.57	29.4%	34.4%
E	86.4%	1.1E5	1.63	25.7%	34.5%
F	83.0%	1.1E5	1.47	40.2%	34.4%
G	86.0%	1.1E5	1.35	43.3%	34.6%

a) Based upon parts of butadiene

By adding the chelating reagent, CA, the molecular weight distribution (Mw/Mn) is narrowed as evidenced by the comparison of Polymers C, D and E made without the chelating reagent, against Polymers F and G made with the chelating reagent.

2. NLiP Initiator and t-AmylOK System

a) Reactor polymerization in n-hexane solution

5 pounds of styrene and butadiene monomer blend (T.S. = 18%), which has 38wt% styrene for total monomer, was charged in 3.8 l (1 gallon) reactor. To this, 3.9mmol of NLiP-2THF initiator, prepared as above, was charged along with 0.19mmol of t-AmylOK. Reaction temperature was set to 140°F (60°C). Polymerization time was 3 hours and observed peak temperature was 155°F (68°C). Then, 1.9mmol of Bu₂SnCl₂ solution was added to the reactor and agitated 30 minutes. Polymer cement was coagulated in i-PrOH, treated with an antioxidant as above, and dried by drum dryer to obtain an SBR, reported herein as a Polymer F.

A comparative example polymer was made by using n-BuLi. Five pounds of 40% styrene and butadiene monomer blend (T.S. = 18%) was charged in 1 gallon reactor. To the reactor, 3.8mmol of n-BuLi and 0.38mmol of t-AmylOK was added. After 1.5 hours polymerization at 160°F (71°C), 1.9mmol of Bu₂SnCl₂ was charged to the reactor. Then the cement was coagulated and drum dried as above, to obtain Polymer I.

Characterizations of these polymers are listed in TABLE IV.

TABLE IV

ANALYSIS OF POLYMERS H AND I					
	Mn	Mw/Mn	ML4	Vinyl ^a	Styrene
Polymer H	1.8E5	1.77	87	22%	38%
Polymer I	2.0E5	1.62	94	19%	43%

a) Based upon parts of butadiene

b) Compound Physical Properties of the Polymer

Polymers H, I and a control, an SBR initiated with BuLi, without the initiator combination of this invention, which was a 20% styrene, 60% vinyl (based upon the butadiene portion), SnCl₄ coupled SBR, were tested for physical properties. Compounding was done by using a standard recipe (parts by weight of Polymer 100, HAF carbon black 48.5, aromatic oil 10.5, sulfur 1.5). Results are summarized in TABLE V.

TABLE V

COMPOUNDED PROPERTIES, POLYMERS H-I				
	RT			tan δ
	Tb(kg/cm2)	Eb(%)	Wear Index	50°C
Example				
Polymer H	256	488	118	0.12
Polymer I	197	420	127	0.15
Comparative				
SBR/SnCl ₄	182	430	100	0.14

Polymer H shows lower hysteresis loss and higher tensile strength and wear resistance than comparative polymers.

3. LHMI Initiator and t-AmyIOK System

a) Reactor Polymerization in n-hexane Solution

Five pounds of styrene and butadiene monomer blend (T.S. = 18%), which had 28 wt% styrene for total monomer, was charged to a 3.8 l (1 gallon) reactor. To this 3.7mmol of LHMI initiator was charged, following which 0.18mmol of t-AmyIOK and 1.1mmol of oligomeric oxolanyl propanes were added. Reaction temperature was set to 160°F (71°C). Polymerization time was 1 hour and observed peak temperature was 175°F (79°C). Then, 0.9mmol of SnCl₄ solution was added to the reactor and agitated 30 minutes. The polymer was isolated as in the foregoing examples, and is reported herein as Polymer J.

Polymer K was made by the same procedure as polymer J except using 38 wt% styrene/62 wt% butadiene instead of 28wt% styrene/72 wt% butadiene monomer blend, and the chelating reagent level was reduced to 0.12 mmol.

Polymer L was made by the same procedure as polymer K except without the chelating reagent.

Characterizations of these polymers are listed in TABLE VI. These polymers were found to have similar glass transition temperatures.

TABLE VI

ANALYSIS OF POLYMERS J-L					
	Mn	Mw/Mn	ML4	Vinyl ^a	Styrene
Polymer H	1.6x10 ⁵	2.05	65	42%	28%
Polymer I	1.6x10 ⁵	2.34	100	22%	38%
Polymer J	1.6x10 ⁵	2.54	118	17%	40%

a) Based upon parts of butadiene

b) Compound Physical Properties of the Polymer

Polymers J, K, L and a control SBR, consisting of 20% styrene, 60% vinyl (based upon 100% butadiene), SnCl₄ coupled SBR, was used for physical property tests. The polymers were compounded in a natural rubber blended recipe (parts by weight of SBR 75, natural rubber 25, HAF carbon black 48.5, aromatic oil 11, sulfur 1.6). Results are summarized in TABLE VII.

TABLE VII

COMPOUNDED PROPERTIES, POLYMERS J-L					
	Tear Strength,				
	100°C		168°C	Wear	tan δ
	Tb(kg/cm ²)	Eb(%)	(kg/cm)	Index	50°C
Example Polymer J	119	414	30	105	0.11
Example Polymer K	127	462	27	116	0.12

TABLE VII (continued)

COMPOUNDED PROPERTIES, POLYMERS J-L					
	Tear Strength,				
	100°C		168°C	Wear	tan δ
	Tb(kg/cm ²)	Eb(%)	(kg/cm)	Index	50°C
Example Polymer L	129	473	32	114	0.13
Comparative SBR/SnCl ₄	108	417	29	100	0.13

These example polymers show higher tensile properties and wear resistance, and also lower hysteresis loss property than the control SBR.

It should now be clear from the foregoing examples and specification disclosure, that initiators according to the present invention are useful for the anionic polymerization of diene monomers. Reproducible polymerization of such polymers within a relatively narrow molecular weight range is achieved, and the resulting polymers also exhibit good preservation of live C-Li ends, when compared to the non-solubilized initiators heretofore known in the art.

Claims

1. A hydrocarbon soluble, anionic polymerization initiator comprising a mixture of:

(i) a lithio amine having the general formula

where y is 0 or from 0.5 to 3; SOL is a solubilizing component selected from the group consisting of hydrocarbons, ethers, amines or mixtures thereof; and, A is selected from the group consisting of dialkyl, alkyl, cycloalkyl or dicycloalkyl amine radicals having the general formula

and cyclic amines having the general formula

where each R₁ is independently selected from the group consisting of alkyls, cycloalkyls and aralkyls having from having from 1 to 12 carbon atoms and R₂ is selected from the group consisting of a divalent alkylene, oxy- or amino-alkylene group having from 3 to 12 methylene groups;

(ii) an organic alkali metal compound; and, optionally,

(iii) a chelating reagent.

2. An anionic polymerization initiator, as set forth in claim 1, wherein the carbon atoms in R₁ and R₂ which are bonded to the nitrogen in the amine, are also bonded to a total of at least three hydrogen atoms.

3. An anionic polymerization initiator, as set forth in claim 1, wherein SOL is a dienylyl or vinyl aromatic oligomer having a degree of polymerization of from 3 to 300 polymerization units.
- 5 4. An anionic polymerization initiator, as set forth in claim 3, wherein SOL is selected from the group consisting of polybutadiene, polystyrene, polyisoprene and copolymers thereof.
5. An anionic polymerization initiator, as set forth in claim 1, wherein SOL is selected from the group consisting of tetrahydrofuran and tetramethylethylenediamine.
- 10 6. An anionic polymerization initiator, as set forth in claim 1, wherein A is selected from the group consisting of 1,3,3-trimethyl-6-azabicyclo [3.2.1] octane, diisobutyl amide; pyrrolidine; piperidine; 4-alkylpiperazine; perhydroazepine; 1-azacyclooctane; and derivatives thereof.
- 15 7. An anionic polymerization initiator, as set forth in claim 6, wherein said pyrrolidine derivative is perhydroindole.
8. An anionic polymerization initiator, as set forth in claim 1, wherein A is selected from the group consisting of di-alkylamines, wherein the alkyl group has from 2 to 5 carbon atoms.
- 20 9. An anionic polymerization initiator, as set forth in claim 1, wherein A is pyrrolidine, y is 2 and SOL is selected from the group consisting of tetrahydrofuran and tetramethylethylenediamine.
10. An anionic polymerization initiator, as set forth in claim 1, wherein A is perhydroazepine, y is 2 and SOL is selected from the group consisting of tetrahydrofuran and tetramethylethylenediamine.
- 25 11. An anionic polymerization initiator, as set forth in claim 1, wherein A is perhydroazepine and y is 0.
12. An anionic polymerization initiator, as set forth in claim 3, wherein said lithio amine has the formula A-(SOL)-Li, and A is pyrrolidine.
- 30 13. An anionic polymerization initiator, as set forth in claim 1, wherein said organic alkali metal compound is selected from the group consisting of compounds having the general formula R_3M , R_4OM , $R_5C(O)OM$, R_6R_7NM , and R_8SO_3M , where R_3 , R_4 , R_5 , R_6 , R_7 , and R_8 are each selected from the group consisting of alkyls, cycloalkyls, alkenyls, aryls, or phenyls, having from 1 to 12 carbon atoms; and where M is selected from the group consisting of Na, K, Rb or Cs.
- 35 14. An anionic polymerization initiator, as set forth in claim 13, wherein M is Na or K, and said mixture comprises a mixture ratio of said organic alkali metal compound of from 0.5 to 0.02 equivalents thereof per equivalent of lithium in said lithio amine.
- 40 15. An anionic polymerization initiator, as set forth in claim 1, wherein said chelating reagent is present and is selected from the group consisting of tetramethylethylene diamine; linear oligomeric oxolanyl alkanes; and, oxolanyl cyclic acetals.
- 45 16. An anionic polymerization initiator, as set forth in claim 15, wherein said mixture comprises a mixture ratio of said chelating reagent of from 0.01 to 2 equivalents thereof per equivalent of lithium in said lithio amine.
- 50 17. A method of preparing an anionic polymerization initiator comprising the steps of:
forming a reaction product by reacting an organolithium compound with a functionalizing agent; said functionalizing agent being selected from the group consisting of alkyl, dialkyl, cycloalkyl or dicycloalkyl amine radicals having the general formula

and cyclic amines having the general formula

where each R_1 is independently selected from the group consisting of and alkyls, cycloalkyls and aralkyls having from 1 to 12 carbon atoms, and R_2 is selected from the group consisting of a divalent alkylene, oxy- or amino-alkylene group having from about 3 to 12 methylene groups;

and mixing said reaction product with an organic alkali metal compound; and a chelating reagent; said organolithium compound having the general formula RLi where R is selected from the group consisting of alkyls, cycloalkyls, alkenyls, aryls and aralkyls having from 1 to 20 carbon atoms and short chain length low molecular weight polymers from diolefin and vinyl aryl monomers having up to about 25 units.

18. A process for preparing an elastomeric compound having reduced hysteresis properties comprising the steps of:

forming a solution of one or more anionically polymerizable monomers in a hydrocarbon solvent; and, polymerizing said monomer with a mixture of a lithio amine, an organic alkali metal compound and optionally a chelating agent to form a polymer; said lithio amine having the general formula

where y is 0 or from about 0.5 to about 3; SOL is a solubilizing component selected from the group consisting of hydrocarbons, ethers, amines or mixtures thereof; and, A is selected from the group consisting of alkyl, dialkyl, cycloalkyl or dicycloalkyl amine radicals having the general formula

and cyclic amines having the general formula

where each R_1 is independently selected from the group consisting of and alkyls, cycloalkyls and aralkyls having from 1 to 12 carbon atoms, and R_2 is selected from the group consisting of a divalent alkylene, oxy- or amino-alkylene group having from 3 to 12 methylene groups.

19. A process, as set forth in claim 18, wherein said monomers are selected from the group consisting of styrene and butadiene, and mixtures thereof.

20. A process, as set forth in claim 18, comprising the further step of reacting the polymerized monomer with a modifying agent selected and derived from the group consisting of terminating agents, coupling agents and linking agents.

21. A process as set forth in claim 20, wherein said modifying agent is selected from the group consisting of carbon dioxide; N,N,N',N'-tetraalkyldiaminobenzophenones; dialkylaminobenzaldehydes; dialkylimidazolidinones; 1-alkyl substituted pyrrolidinones; 1-aryl substituted pyrrolidinones; dialkyl- and dicycloalkyl-carbodiimides having from 5 to 20 carbon atoms; $(R_{15})_aZX_b$;

and,

where Z is tin or silicon; R_{15} is selected from the group consisting of alkyls having from 1 to 20 carbon atoms, cycloalkyls having from 3 to 20 carbon atoms, aryls having from 6 to 20 carbon atoms and aralkyls having from 7 to 20 carbon atoms; X is chlorine or bromine; a is from 0 to 3 and b is from 1 to 4 where $a + b = 4$; each R_{16} is the same or different and is selected from the group consisting of alkyls, cycloalkyls and aryls, having from 1 to 12 carbon atoms; R_{17} is selected from the group consisting of t-alkyls, phenyls, alkylphenyls and N,N-dialkylaminophenyls, having from 4 to 20 carbon atoms; each R_{18} is the same or different, and is selected from the group consisting of alkyls and cycloalkyls having from 1 to 12 carbon atoms; and, R_{19} is selected from the group consisting of alkyls, phenyls, alkylphenyls and N,N-dialkylaminophenyls having from 1 to 20 carbon atoms, and mixtures thereof.

22. A process as set forth in claim 21, wherein the two R_{18} groups together form a cyclic group.

23. A process as set forth in claim 18 comprising the further step of compounding said polymer with from 5 to 80 parts by weight of carbon black, per 100 parts of said polymer, to form a vulcanizable compound.

24. A process as set forth in claim 23, comprising the further step of forming a treadstock from said vulcanizable compound.

25. A process as set forth in claim 24, comprising the further step of forming a tire having at least one component formed from said treadstock compound.

26. A polymer prepared by forming a solution of one or more anionically polymerizable monomers in a hydrocarbon solvent; and,

polymerizing said monomer with a mixture of a lithio amine, an organic alkali metal compound and optionally a chelating agent to form a polymer;

said lithio amine having the general formula

where y is 0 or from 0.5 to 3; SOL is a solubilizing component selected from the group consisting of hydrocarbons, ethers, amines or mixtures thereof; and, A is selected from the group consisting of alkyl, dialkyl, cycloalkyl or dicycloalkyl amine radicals having the general formula

and cyclic amines having the general formula

where each R_1 is independently selected from the group consisting of and alkyls, cycloalkyls and aralkyls having from 1 to 12 carbon atoms, and R_2 is selected from the group consisting of a divalent alkylene, oxy- or amino-alkylene group having from 3 to 12 methylene groups.

27. A polymer as set forth in claim 26, comprising a tin-carbon bond.

28. A vulcanizable elastomer formed by compounding the polymer of claim 26 with from 5 to 80 parts by weight of carbon black, per 100 parts of the polymer.

29. A treadstock compound formed from the vulcanizable elastomer of claim 28.

30. A tire having at least one component formed from the treadstock compound of claim 29.

Patentansprüche

1. Kohlenwasserstofflöslicher, anionischer Polymerisationsinitiator, umfassend ein Gemisch aus:

(i) einem Lithioamin der allgemeinen Formel

worin y den Wert 0 oder 0,5 bis 3 hat, SOL für eine solubilisierende Komponente, ausgewählt aus der Gruppe bestehend aus Kohlenwasserstoffen, Ethern, Aminen oder Gemischen davon, steht, und A aus der Gruppe bestehend aus Dialkyl-, Alkyl-, Cycloalkyl- oder Dicycloalkylaminresten mit der allgemeinen Formel

und cyclischen Aminen mit der allgemeinen Formel

ausgewählt ist, wobei jede Gruppe R_1 unabhängig aus der Gruppe bestehend aus Alkyl-, Cycloalkyl- und Aralkylresten mit 1 bis 12 Kohlenstoffatomen ausgewählt ist, und R_2 aus der Gruppe bestehend aus zweiwertigen Alkyl-, Oxy- oder Aminoalkylresten mit 3 bis 12 Methylengruppen ausgewählt ist;
(ii) einer organischen Alkalimetallverbindung; und gegebenenfalls
(iii) einem Cheliermittel.

2. Anionischer Polymerisationsinitiator nach Anspruch 1, dadurch **gekennzeichnet**, daß die Kohlenstoffatome in R_1 und R_2 , die an das Stickstoffatom in dem Amin gebunden sind, auch an insgesamt mindestens drei Wasserstoffatome gebunden sind.
3. Anionischer Polymerisationsinitiator nach Anspruch 1, dadurch **gekennzeichnet**, daß SOL für ein dienyl- oder vinylaromatisches Oligomeres mit einem Polymerisationsgrad von 3 bis 300 Polymerisationseinheiten steht.
4. Anionischer Polymerisationsinitiator nach Anspruch 3, dadurch **gekennzeichnet**, daß SOL aus der Gruppe bestehend aus Polybutadien, Polystyrol, Polyisopren und Copolymeren davon ausgewählt ist.
5. Anionischer Polymerisationsinitiator nach Anspruch 1, dadurch **gekennzeichnet**, daß SOL aus der Gruppe bestehend aus Tetrahydrofuran und Tetramethylethyldiamin ausgewählt ist.
6. Anionischer Polymerisationsinitiator nach Anspruch 1, dadurch **gekennzeichnet**, daß A aus der Gruppe bestehend aus 1,3,3-Trimethyl-6-azabicyclo[3.2.1]octan, Diisobutylamid, Pyrrolidin, Piperidin, 4-Alkylpiperazin, Perhydroazepin, 1-Azacyclooctan und Derivaten davon ausgewählt ist.
7. Anionischer Polymerisationsinitiator nach Anspruch 6, dadurch **gekennzeichnet**, daß das Pyrrolidinderivat Perhydroindol ist.
8. Anionischer Polymerisationsinitiator nach Anspruch 1, dadurch **gekennzeichnet**, daß A aus der Gruppe bestehend aus Di-n-alkylaminen, wobei die Alkylgruppe 2 bis 5 Kohlenstoffatome besitzt, ausgewählt ist.
9. Anionischer Polymerisationsinitiator nach Anspruch 1, dadurch **gekennzeichnet**, daß A für Pyrrolidin steht, y den Wert 2 hat und SOL aus der Gruppe bestehend aus Tetrahydrofuran und Tetramethylethyldiamin ausgewählt ist.
10. Anionischer Polymerisationsinitiator nach Anspruch 1, dadurch **gekennzeichnet**, daß A für Perhydroazepin steht, y den Wert 2 hat und SOL aus der Gruppe bestehend aus Tetrahydrofuran und Tetramethylethyldiamin ausgewählt ist.

11. Anionischer Polymerisationsinitiator nach Anspruch 1, dadurch **gekennzeichnet**, daß A für Perhydroazepin steht und y den Wert 0 hat.
12. Anionischer Polymerisationsinitiator nach Anspruch 3, dadurch **gekennzeichnet**, daß das Li-thioamin die Formel A-(SOL)-Li hat, und daß A für Pyrrolidin steht.
13. Anionischer Polymerisationsinitiator nach Anspruch 1, dadurch **gekennzeichnet**, daß die organische Alkalimetallverbindung aus der Gruppe bestehend aus Verbindungen mit der allgemeinen Formel R_3M , R_4OM , $R_5C(O)OM$, R_6R_7NM und R_8SO_3M ausgewählt ist, wobei R_3 , R_4 , R_5 , R_6 , R_7 und R_8 jeweils aus der Gruppe bestehend aus Alkyl-, Cycloalkyl-, Alkenyl-, Aryl- oder Phenylresten mit 1 bis 12 Kohlenstoffatomen ausgewählt sind, und M aus der Gruppe bestehend aus Na, K, Rb oder Cs ausgewählt ist.
14. Anionischer Polymerisationsinitiator nach Anspruch 13, dadurch **gekennzeichnet**, daß M für Na oder K steht und daß in dem Gemisch das Mischverhältnis der organischen Alkalimetallverbindung 0,5 bis 0,02 Äquivalente pro Äquivalent Lithium in dem Lithioamin beträgt.
15. Anionischer Polymerisationsinitiator nach Anspruch 1, dadurch **gekennzeichnet**, daß das Chelermittel vorhanden ist und aus der Gruppe bestehend aus Tetramethylethylendiamin, linearen oligomeren Oxolanylalkanen und Oxolanyl-cyclisch-Acetalen ausgewählt ist.
16. Anionischer Polymerisationsinitiator nach Anspruch 15, dadurch **gekennzeichnet**, daß in dem Gemisch das Mischverhältnis des Chelermittels 0,01 bis 2 Äquivalente pro Äquivalent Lithium in dem Lithioamin beträgt.
17. Verfahren zur Herstellung eines anionischen Polymerisationsinitiators, umfassend die Stufen:

Bildung eines Reaktionsprodukts durch Umsetzung einer Organolithiumverbindung mit einem Funktionalisierungsmittel, wobei das Funktionalisierungsmittel aus der Gruppe bestehend aus Alkyl-, Dialkyl-, Cycloalkyl- oder Dicycloalkylaminresten der allgemeinen Formel

und cyclischen Aminen der allgemeinen Formel

ausgewählt wird, wobei jede Gruppe R_1 unabhängig aus der Gruppe bestehend aus Alkyl-, Cycloalkyl- und Aralkylresten mit 1 bis 12 Kohlenstoffatomen ausgewählt wird, und R_2 aus der Gruppe bestehend aus zweiwertigen Alkyl-, Oxy- oder Aminoalkylresten mit etwa 3 bis 12 Methylengruppen ausgewählt wird;

und Vermischen des genannten Reaktionsprodukts mit einer organischen Alkalimetallverbindung und einem Chelermittel;

wobei die Organolithiumverbindung die allgemeine Formel RLi besitzt, worin R aus der Gruppe bestehend aus Alkyl-, Cycloalkyl-, Alkenyl-, Aryl- und Aralkylresten mit 1 bis 20 Kohlenstoffatomen und kurzkettigen Polymeren mit niedrigem Molekulargewicht aus Diolefin- und Vinylarylmonomeren mit bis zu etwa 25 Einheiten ausgewählt wird.

18. Verfahren zur Herstellung einer Elastomerverbindung mit verminderten Hystereseeigenschaften, umfassend die

Stufen:

Bildung einer Lösung von einem oder mehreren anionisch polymerisierbaren Monomeren in einem Kohlenwasserstoff-Lösungsmittel; und

Polymerisation des genannten Monomeren mit einem Gemisch aus einem Lithioamin, einer organischen Alkalimetallverbindung und gegebenenfalls einem Chelermittel, um ein Polymeres zu bilden, wobei das Lithioamin die allgemeine Formel

hat, worin y den Wert 0 oder 0,5 bis 3 hat, SOL für eine solubilisierende Komponente, ausgewählt aus der Gruppe bestehend aus Kohlenwasserstoffen, Ethern, Aminen oder Gemischen davon, steht, und A aus der Gruppe bestehend aus Alkyl-, Dialkyl-, Cycloalkyl- oder Dicycloalkylaminresten mit der allgemeinen Formel

und cyclischen Aminen mit der allgemeinen Formel

ausgewählt ist, wobei jede Gruppe R_1 unabhängig aus der Gruppe bestehend aus Alkyl-, Cycloalkyl- und Arylresten mit 1 bis 12 Kohlenstoffatomen ausgewählt ist, und R_2 aus der Gruppe bestehend aus zweiwertigen Alkyl-, Oxy- oder Aminoalkylresten mit 3 bis 12 Methylengruppen ausgewählt ist.

19. Verfahren nach Anspruch 18, dadurch **gekennzeichnet**, daß die Monomeren aus der Gruppe bestehend aus Styrol und Butadien und Gemischen davon ausgewählt werden.

20. Verfahren nach Anspruch 18, dadurch **gekennzeichnet**, daß es die weitere Stufe der Umsetzung des polymerisierten Monomeren mit einem Modifizierungsmittel, ausgewählt und abgeleitet aus der Gruppe bestehend aus Terminierungsmitteln, Kupplungsmitteln und Vernetzungsmitteln, umfaßt.

21. Verfahren nach Anspruch 20, dadurch **gekennzeichnet**, daß das Modifizierungsmittel aus der Gruppe bestehend aus Kohlendioxid, N,N,N',N'-Tetraalkyldiaminobenzophenonen, Dialkylaminobenzaldehyden, Dialkylimidazolidinonen, 1-Alkyl-substituierten Pyrrolidinonen, 1-Aryl-substituierten Pyrrolidinonen, Dialkyl- und Dicycloalkylcarbodiimiden mit 5 bis 20 Kohlenstoffatomen, $(R_{15})_aZX_b$,

und

ausgewählt wird, worin Z für Zinn oder Silicium steht, R_{15} aus der Gruppe bestehend aus Alkylresten mit 1 bis 20 Kohlenstoffatomen, Cycloalkylresten mit 3 bis 20 Kohlenstoffatomen, Arylresten mit 6 bis 20 Kohlenstoffatomen und Aralkylresten mit 7 bis 20 Kohlenstoffatomen ausgewählt wird, X für Chlor oder Brom steht, a einen Wert von 0 bis 3 hat und b einen Wert von 1 bis 4 hat, wobei $a + b = 4$, wobei jede Gruppe R_{16} gleich oder verschieden ist und aus der Gruppe bestehend aus Alkyl-, Cycloalkyl- und Arylresten mit 1 bis 12 Kohlenstoffatomen ausgewählt wird, R_{17} aus der Gruppe bestehend aus t-Alkyl-, Phenyl-, Alkylphenyl- und N,N-Dialkylaminophenylresten mit 4 bis 20 Kohlenstoffatomen ausgewählt wird, wobei jede Gruppe R_{18} gleich oder verschieden ist und aus der Gruppe bestehend aus Alkyl- und Cycloalkylresten mit 1 bis 12 Kohlenstoffatomen ausgewählt wird, und R_{19} aus der Gruppe bestehend aus Alkyl-, Phenyl-, Alkylphenyl- und N,N-Dialkylaminophenylresten mit 1 bis 20 Kohlenstoffatomen und Gemischen davon ausgewählt wird.

22. Verfahren nach Anspruch 21, dadurch **gekennzeichnet**, daß die zwei Gruppen R_{18} miteinander eine cyclische Gruppe bilden.
23. Verfahren nach Anspruch 18, dadurch **gekennzeichnet**, daß es eine weitere Stufe der Compoundierung des Polymeren mit 5 bis 80 Gew.-Teilen Ruß pro 100 Gew.-Teile Polymeres zur Bildung einer vulkanisierbaren Masse umfaßt.
24. Verfahren nach Anspruch 23, dadurch **gekennzeichnet**, daß es die weitere Stufe der Bildung einer Laufflächenmasse aus der vulkanisierbaren Masse umfaßt.
25. Verfahren nach Anspruch 24, dadurch **gekennzeichnet**, daß es die weitere Stufe der Bildung eines Reifens mit mindestens einer Komponente, gebildet aus der genannten Laufflächenmasse, umfaßt.
26. Polymeres, hergestellt durch Bildung einer Lösung von einem oder mehreren anionisch polymerisierbaren Mono-

meren in einem Kohlenwasserstoff-Lösungsmittel; und

Polymerisation des Monomeren mit einem Gemisch aus einem Lithioamin, einer organischen Alkalimetallverbindung und gegebenenfalls einem Cheliermittel, um ein Polymeres zu bilden,

wobei das Lithioamin die allgemeine Formel

hat, worin y den Wert 0 oder 0,5 bis 3 hat, SOL für eine solubilisierende Komponente, ausgewählt aus der Gruppe bestehend aus Kohlenwasserstoffen, Ethern, Aminen oder Gemischen davon, steht, und A aus der Gruppe bestehend aus Alkyl-, Dialkyl-, Cycloalkyl- oder Dicycloalkylaminresten mit der allgemeinen Formel

und cyclischen Aminen mit der allgemeinen Formel

ausgewählt ist, wobei jede Gruppe R_1 unabhängig aus der Gruppe bestehend aus Alkyl-, Cycloalkyl- und Aralkylresten mit 1 bis 12 Kohlenstoffatomen ausgewählt ist, und R_2 aus der Gruppe bestehend aus zweiwertigen Alkyl-, Oxy- oder Aminoalkylenresten mit 3 bis 12 Methylengruppen ausgewählt ist.

27. Polymeres nach Anspruch 26, dadurch **gekennzeichnet**, daß es eine Zinn-Kohlenstoff-Bindung enthält.

28. Vulkanisierbares Elastomeres, gebildet durch Vermischen des Polymeren nach Anspruch 26, mit 5 bis 80 Gew.-Teilen Ruß pro 100 Teile des Polymeren.

29. Laufflächenmasse, gebildet aus dem vulkanisierbaren Elastomeren nach Anspruch 28.

30. Reifen mit mindestens einer Komponente, die aus der Laufflächenmasse nach Anspruch 29 gebildet worden ist.

Revendications

1. Initiateur de polymérisation anionique, soluble dans les hydrocarbures, comprenant un mélange :

(i) d'une lithioamine répondant à la formule générale

dans laquelle y a une valeur de 0 ou de 0,5 à 3 ; SOL est un composant solubilisant choisi dans le groupe consistant en hydrocarbures, éthers, amines ou leurs mélanges ; et A est choisi dans le groupe consistant en radicaux dialkyl-, alkyl, cycloalkyl-, ou dicycloalkylamino répondant à la formule générale

et en radicaux amino cycliques répondant à la formule générale

formules dans lesquelles chaque R_1 est choisi, indépendamment, dans le groupe consistant en radicaux alkyle, cycloalkyle et aralkyle ayant 1 à 12 atomes de carbone et R_2 est choisi dans le groupe consistant en un groupe alkylène, oxyalkylène ou amino-alkylène divalent ayant 3 à 12 groupes méthylène ;
 (ii) un composé organique de métal alcalin ; et, à titre facultatif
 (iii) un réactif de chélation.

2. Initiateur de polymérisation anionique suivant la revendication 1, dans lequel les atomes de carbone présents dans R_1 et R_2 qui sont liés à l'azote de l'amine sont aussi liés à un total d'au moins 3 atomes d'hydrogène.
3. Initiateur de polymérisation anionique suivant la revendication 1, dans lequel SOL est un oligomère diénylique ou vinylique aromatique ayant un degré de polymérisation de 3 à 300 motifs de polymérisation.
4. Initiateur de polymérisation anionique suivant la revendication 3, dans lequel SOL est choisi dans le groupe consistant en polybutadiène, polystyrène, polyisoprène et leurs copolymères.
5. Initiateur de polymérisation anionique suivant la revendication 1, dans lequel SOL est choisi dans le groupe consistant en tétrahydrofuranne et tétraméthyléthylène-diamine.
6. Initiateur de polymérisation anionique suivant la revendication 1, dans lequel A est choisi dans le groupe consistant en 1,3,3-triméthyl-6-azabicyclo-[3.2.1]-octane, diisobutylamide ; pyrrolidine ; pipéridine ; 4-alkylpipérazine ; perhydroazépine ; 1-azacyclo-octane ; et leurs dérivés.
7. Initiateur de polymérisation anionique suivant la revendication 6, dans lequel le dérivé de pyrrolidine est le perhydroindole.
8. Initiateur de polymérisation anionique suivant la revendication 1, dans lequel A est choisi dans le groupe consistant en di-n-alkylamines dont le groupe alkyle a 2 à 5 atomes de carbone.
9. Initiateur de polymérisation anionique suivant la revendication 1, dans lequel A est la pyrrolidine, y est égal à 2 et SOL est choisi dans le groupe consistant en tétrahydrofuranne et tétraméthyléthylène-diamine.
10. Initiateur de polymérisation anionique suivant la revendication 1, dans lequel A est la perhydroazépine, y est égal à 2 et SOL est choisi dans le groupe consistant en tétrahydrofuranne et tétraméthyléthylène-diamine.
11. Initiateur de polymérisation anionique suivant la revendication 1, dans lequel A est la perhydroazépine et y est égal à 0.
12. Initiateur de polymérisation anionique suivant la revendication 3, dans lequel la lithioamine répond à la formule A-(SOL)-Li et A est la pyrrolidine.
13. Initiateur de polymérisation anionique suivant la revendication 1, dans lequel le composé organique de métal

alcalin est choisi dans le groupe consistant en composés répondant aux formules générales R_3M , R_4OM , $R_5C(O)OM$, R_6R_7NM et R_8SO_3M où R_3 , R_4 , R_5 , R_6 , R_7 et R_8 sont choisis chacun dans le groupe consistant en radicaux alkyle, cycloalkyle, alcényle, aryle ou phényle, ayant 1 à 12 atomes de carbone ; et M est choisi dans le groupe consistant en Na, K, Rb ou Cs.

- 5
14. Initiateur de polymérisation anionique suivant la revendication 13, dans lequel M représente Na ou K et le mélange en question comprend un rapport de mélange du composé organique de métal alcalin en question de 0,5 à 0,02 équivalent de ce composé par équivalent de lithium dans la lithioamine.
- 10
15. Initiateur de polymérisation anionique suivant la revendication 1, dans lequel le réactif de chélation est présent et est choisi dans le groupe consistant en tétraméthyléthylène-diamine ; oxolanyl-alcanes oligomériques linéaires ; et oxolanyl-acétals cycliques.
- 15
16. Initiateur de polymérisation anionique suivant la revendication 15, dans lequel le mélange comprend un rapport de mélange du réactif de chélation en question de 0,01 à 2 équivalents de ce réactif par équivalent de lithium dans la lithioamine.
17. Procédé de préparation d'un initiateur de polymérisation anionique, qui comprend les étapes consistant :

20 à former un produit de réaction en faisant réagir un composé organique de lithium avec un agent fonctionnalisant ; cet agent fonctionnalisant étant choisi dans le groupe consistant en radicaux alkyl-, dialkyl-, cycloalkyl- ou dicycloalkylamino répondant à la formule générale

30 et amino cycliques répondant à la formule générale

40 formules dans lesquelles chaque R_1 est choisi, indépendamment, dans le groupe consistant en radicaux alkyle, cycloalkyle et aralkyle ayant 1 à 12 atomes de carbone et R_2 est choisi dans le groupe consistant en un groupe alkylène, oxyalkylène ou aminoalkylène divalent ayant environ 3 à 12 groupes méthylène ;
et à mélanger ce produit de réaction avec un composé organique de métal alcalin ; et un réactif de chélation ;
ce composé organique de lithium répondant à la formule générale RLi dans laquelle R est choisi dans le
45 groupe consistant en radicaux alkyle, cycloalkyle, alcényle, aryle et aralkyle ayant 1 à 20 atomes de carbone et en polymères de bas poids moléculaire à courte longueur de chaîne dérivés de dioléfinés et de monomères vinylyriques ayant jusqu'à environ 25 motifs.

- 50 18. Procédé de production d'un composé élastomérique ayant des propriétés d'hystérésis réduite, qui comprend les étapes consistant :

à former une solution d'un ou plusieurs monomères susceptibles de polymérisation anionique dans un solvant hydrocarboné ; et,
à polymériser ce monomère avec un mélange d'une lithioamine, d'un composé organique de métal alcalin et,
55 à titre facultatif, d'un agent de chélation pour former un polymère ;
cette lithioamine répondant à la formule générale

dans laquelle y est égal à 0 ou a une valeur d'environ 0,5 à environ 3 ; SOL est un composant solubilisant choisi dans le groupe consistant en hydrocarbures, éthers, amines ou leurs mélanges ; et A est choisi dans le groupe consistant en radicaux alkyl-, dialkyl-, cycloalkyl-, ou dicycloalkylamino répondant à la formule générale

et amino cycliques répondant à la formule générale

formules dans lesquelles chaque R_1 est choisi indépendamment, dans le groupe consistant en radicaux alkyle, cycloalkyle et aralkyle ayant 1 à 12 atomes de carbone et R_2 est choisi dans le groupe consistant en un groupe alkylène, oxyalkylène ou aminoalkylène divalent ayant 3 à 12 groupes méthylène.

19. Procédé suivant la revendication 18, dans lequel les monomères en question sont choisis dans le groupe consistant en styrène et butadiène et leurs mélanges.
20. Procédé suivant la revendication 18, comprenant en outre l'étape de réaction du monomère polymérisé avec un agent modificateur choisi dans le groupe et dérivé du groupe consistant en agents de terminaison, agents de couplage et agents de liaison.
21. Procédé suivant la revendication 20, dans lequel l'agent modificateur est choisi dans le groupe consistant en anhydride carbonique ; N,N,N',N'-tétra-alkyldiaminobenzophénones ; dialkylaminobenzaldéhydes ; dialkylimidazolidinones ; pyrrolidinones à substituant 1-alkyle ; pyrrolidinone à substituant 1-aryle ; dialkyl- et dicycloalkylcarbodiimides ayant 5 à 20 atomes de carbone ; $(R_{15})_a ZX_b$;

et,

où Z représente l'étain ou le silicium ; R_{15} est choisi dans le groupe consistant en radicaux alkyle ayant 1 à 20 atomes de carbone, cycloalkyle ayant 3 à 20 atomes de carbone, aryle ayant 6 à 20 atomes de carbone et aralkyle ayant 7 à 20 atomes de carbone ; X représente le chlore ou le brome ; a a une valeur de 0 à 3 et b a une valeur de 1 à 4 ; la somme a + b étant égale à 4 ; chacun des groupes R_{16} , identiques ou différents, est choisi dans le groupe consistant en radicaux alkyle, cycloalkyle et aryle, ayant 1 à 12 atomes de carbone ; R_{17} est choisi dans le groupe consistant en radicaux tertioalkyle, phényle, alkylphényle et N,N-dialkylaminophényle, ayant 4 à 20 atomes de carbone ; chacun des groupes R_{18} , identiques ou différents, est choisi dans le groupe consistant en radicaux alkyle et cycloalkyle ayant 1 à 12 atomes de carbone ; et R_{19} est choisi dans le groupe consistant en radicaux alkyle, phényle, alkylphényle et N,N-dialkylaminophényle ayant 1 à 20 atomes de carbone, et leurs mélanges.

22. Procédé suivant la revendication 21, dans lequel les deux groupes R_{18} forment ensemble un groupe cyclique.
23. Procédé suivant la revendication 18, comprenant en outre l'étape de formulation du polymère avec 5 à 80 parties en poids de noir de carbone pour 100 parties en poids de polymère, pour former un mélange vulcanisable.
24. Procédé suivant la revendication 23, comprenant en outre l'étape de formation d'un matériau pour bande de roulement à partir de ce mélange vulcanisable.
25. Procédé suivant la revendication 24, comprenant en outre l'étape de formation d'un bandage pneumatique ayant au moins un composant formé à partir du mélange pour bande de roulement en question.
26. Polymère produit par formation d'une solution d'un ou plusieurs monomères polymérisables par voie anionique dans un solvant hydrocarboné ; et

polymérisation de ce monomère avec un mélange d'une lithioamine, d'un composé organique de métal alcalin et, à titre facultatif, d'un agent de chélation pour former un polymère ;
cette lithioamine répondant à la formule générale :

dans laquelle y est égal à 0 ou a une valeur de 0,5 à 3 ; SOL est un composant solubilisant choisi dans le groupe consistant en hydrocarbures, éthers, amines ou leurs mélanges ; et A est choisi dans le groupe consistant en radicaux alkyl-, dialkyl-, cycloalkyl- ou dicycloalkylamino répondant à la formule générale

et amino cycliques répondant à la formule générale

formules dans lesquelles chaque R_1 est choisi, indépendamment, dans le groupe consistant en radicaux alkyle, cycloalkyle et aralkyle ayant 1 à 12 atomes de carbone et R_2 est choisi dans le groupe consistant en un groupe alkylène, oxyalkylène ou amino-alkylène divalent ayant 3 à 12 groupes méthylène.

27. Polymère suivant la revendication 26, comprenant une liaison étain-carbone.
28. Elastomère vulcanisable, obtenu par formulation du polymère suivant la revendication 26 avec 5 à 80 parties en poids de noir de carbone pour 100 parties en poids de polymère.
29. Mélange pour bande de roulement formé à partir de l'élastomère vulcanisable de la revendication 28.
30. Bandage pneumatique ayant au moins un composant formé du mélange pour bande de roulement suivant la revendication 29.
